# The Networking “Planes”

- **Data plane:** processing and delivery of packets with local forwarding state
  - Forwarding state + packet header with forwarding decision
  - Tasks: Filtering, buffering, scheduling
- **Control plane:** computing the forwarding state in routers
  - Determines how and where packets are forwarded
  - Tasks: Routing, (automatic) traffic engineering, failure detection/recovery, ...
- **Management plane:** configuring and tuning the network
  - Task: (Manual) traffic engineering, ACL config, device provisioning, ...

# The Networking “Planes”

## Timescale & Location of Each “Planes”

	Data Plane	Control Plane	Management Plane
Time-scale	Packet (nsec)	Event (10 msec to sec)	Human (min to hours)
Location	Linecard hardware	Router software	Humans or software scripts

# Challenges in Networking

- Many task-specific protocols and control mechanisms
  - No modularity, limited functionality
- Indirect control mechanisms
  - Must invert protocol behavior, “coax” it to do what you want
  - E.g. Changing weights instead of the actual paths for traffic engineering
- Uncoordinated control mechanisms due to distributed nature
  - Cannot control which router updates first
- Complex interactions between protocols and mechanisms
  - Routing, addressing, access control, QoS

# Challenges in Networking

- Therefore, Computer networks are:
  1. Hard to reason about
  2. Hard to evolve as a whole
  3. Expensive to build, operate and manage

# Software Defined Networking Definition

- A network in which the **control plane is physically separate from the data plane** and a **single (logically centralized) control plane** controls several forwarding devices (data planes).
- In a simple way, having a central, physically separate controller for many routers and switches in the network.

# Software Defined Networking Definition

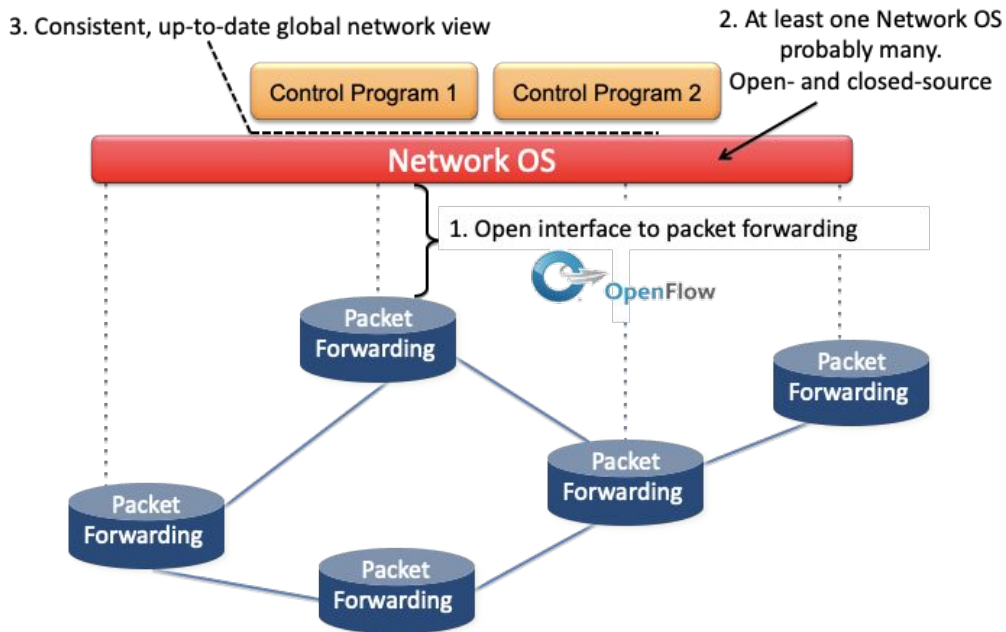

# Why is this Better?

- **Simpler management**
  - No need to “invert” control-plane operations
- **Faster pace of innovation**
  - Less dependence on vendors and standards
- **Easier interoperability**
  - Compatibility only in “wire” protocols
- **Simpler, cheaper equipment**
  - Minimal software
  - Minimal hardware

# Components of SDN

# OpenFlow

- OpenFlow allows remote management of switch rules
  - OF switches use dedicated network link to a controller
    - Controller is often a 'normal' server, e.g., running Linux
  - Typically for first-time packet forwarding, call out to controller
  - Controller provides resulting packet matching rules & actions
  - Establishes flow to potentially be used for subsequent packets
- OF can be easily implemented within existing switches
  - OF controller can co-exist well with existing control programs

# Agenda for Today

- OpenFlow Part II
- Mininet
- NFV
  - Openstack
- Readings
  - Recommended:  
<http://conferences.sigcomm.org/hotnets/2010/papers/a19-lantz.pdf>
  - Optional: <https://queue.acm.org/detail.cfm?id=2560327>

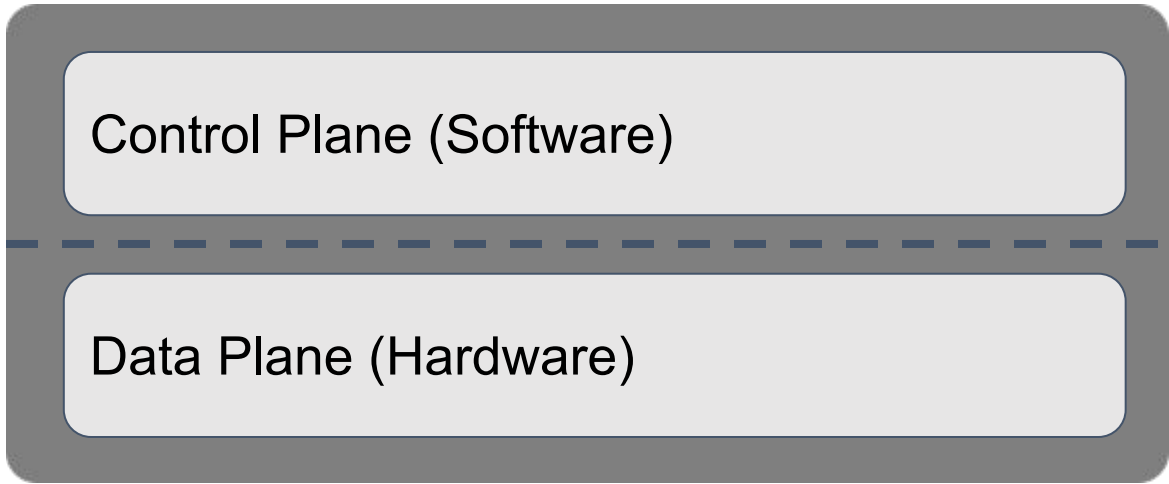

# How does OpenFlow Work?

# Consider a Switch

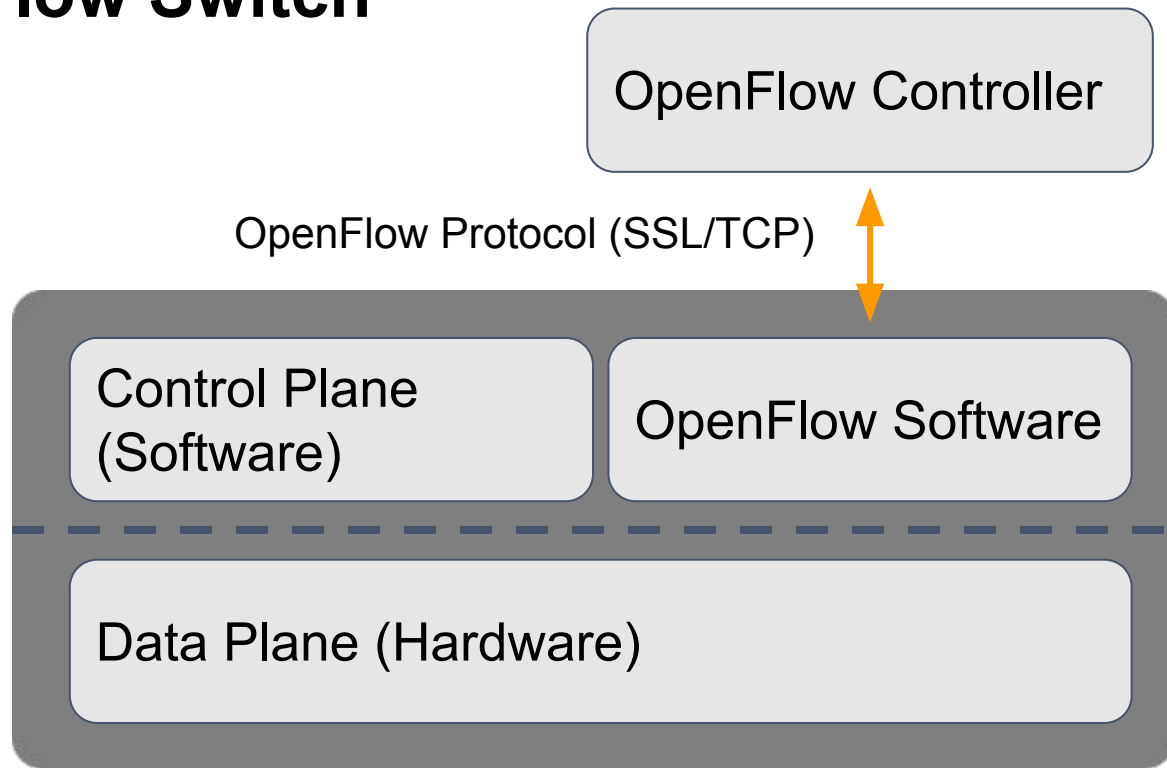

# Traditional Switch

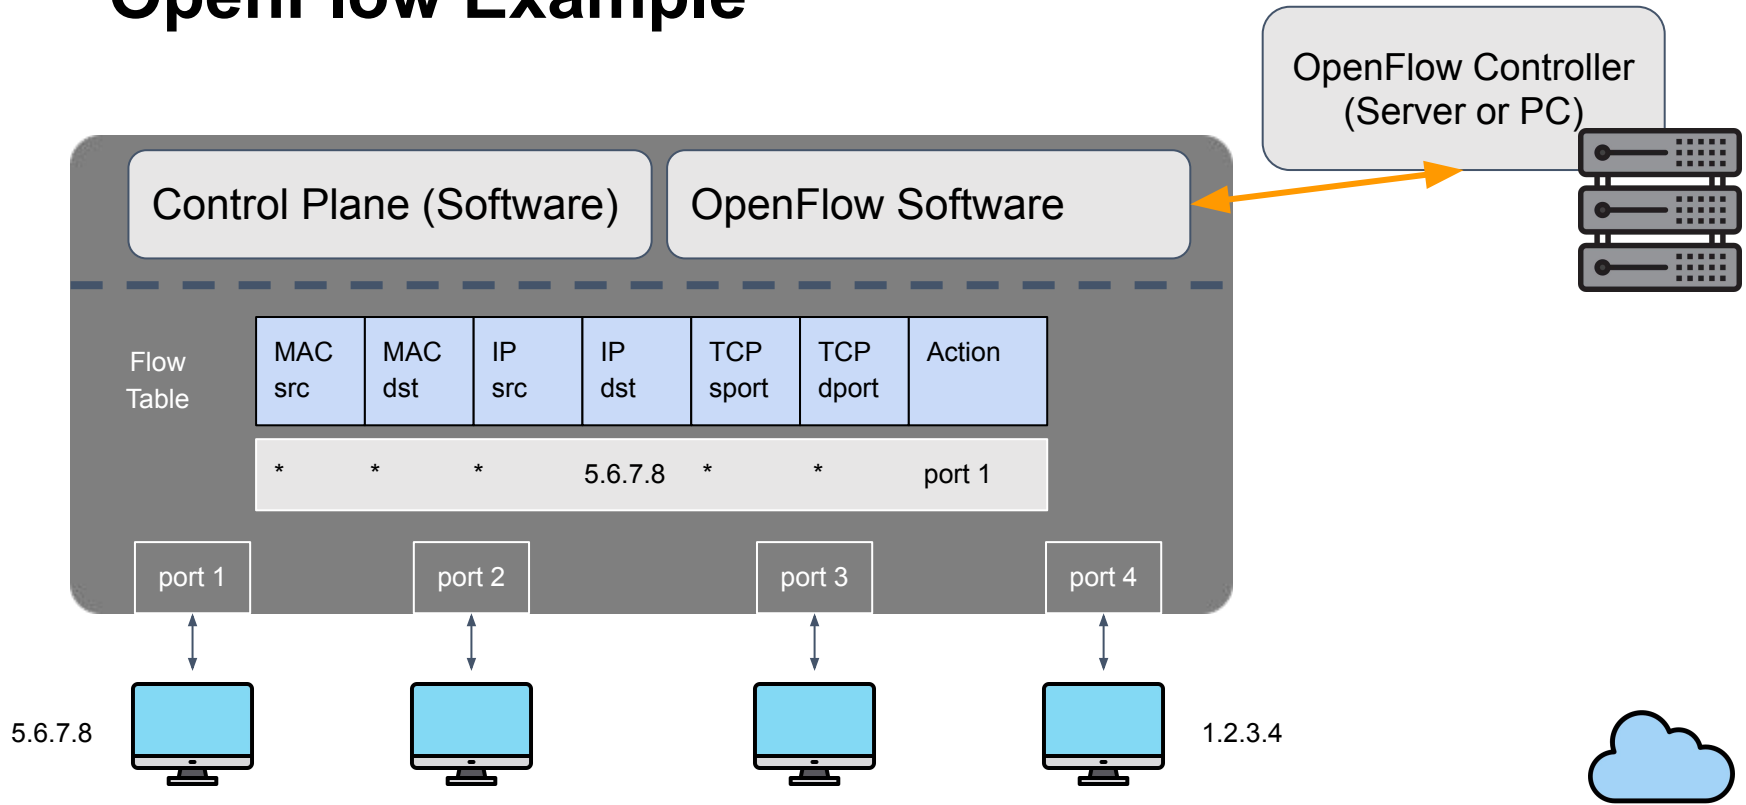

# OpenFlow Switch

# OpenFlow Example

# OpenFlow Basics

# Examples

- Switching

Switch Port	VLAN ID	VLAN pcp	MAC src	MAC dst	Eth Type	IP src	IP dst	IP ToS	IP Proto	L4 sport	L4 dport	Action
*	*	*	*	00:1f:...	*	*	*	*	*	*	*	port 4

- Firewall

Switch Port	VLAN ID	VLAN pcp	MAC src	MAC dst	Eth Type	IP src	IP dst	IP ToS	IP Proto	L4 sport	L4 dport	Action
*	*	*	*	*	*	*	*	*	*	*	22	drop

# Examples

- Routing

Switch Port	VLAN ID	VLAN pcp	MAC src	MAC dst	Eth Type	IP src	IP dst	IP ToS	IP Proto	L4 sport	L4 dport	Action
*	*	*	*	*	*	*	5.6.7.8	*	*	*	*	port 1

- VLAN Switching

Switch Port	VLAN ID	VLAN pcp	MAC src	MAC dst	Eth Type	IP src	IP dst	IP ToS	IP Proto	L4 sport	L4 dport	Action
*	vlan 1	*	*	00:1f..	*	*	*	*	*	*	*	port 2

# Centralized vs Distributed Controller

Centralized

Distributed

Controller

Switch

# Centralized vs Distributed Controller

- Distributed Controller improves scalability
  - E.g., Many packets to capture
- Still requires lot of packets through the control channels
- How to solve this issue?
  - Modify the data plane
  - At the loss of visibility

# Types of Flow Rules

- Flow-based
  - Every flow is individually set up by controller
  - Exact-match flow entries
  - Flow table contains one entry per flow
  - Good for fine grain control, e.g. campus networks
- Aggregated
  - One flow entry covers large groups of flows
  - Wildcard flow entries
  - Flow table contains one entry per category of flows
  - Good for large number of flows, e.g. backbone

# Flow Rule Installation Methods

- **Reactive**
  - First packet of flow triggers controller to insert flow entries
  - Efficient use of flow table
  - Every flow incurs small additional flow setup time
  - If control connection lost, switch has limited utility
  
- **Proactive**
  - Controller pre-populates flow table in switch
  - Zero additional flow setup time
  - Loss of control connection does not disrupt traffic
  - Essentially requires aggregated (wildcard) rules

# Mininet Overview

## So now what?

- We have learned many interesting concepts regarding SDN
- But SDN is a concept that applies within a cloud
- So, how can we even test and try new technologies in SDN?
- **Mininet to the rescue!**
  - We will try mininet out for HW 3 as well

# What is Mininet?

- Software for development and testing of network tools and protocols
- Creates virtual network on any type of machine (VM or native)
- Enables the following features:
  - Fast prototyping for new networking protocols
  - Simplified testing for complex topologies without buying expensive hardware
  - Realistic execution as it runs real code on the Unix and Linux kernels
  - Large open source community
- Designed for experiment in SDN

# What is Mininet?

- Mininet provides network **emulation** opposed to **simulation**, allowing all network software at any layer to be simply run as is
- Mininet's logical nodes can be connected into networks
- Nodes are also called containers or network namespaces
- Nodes consume sufficiently few resources
  - Networks of over a thousand nodes have been created, running on a laptop

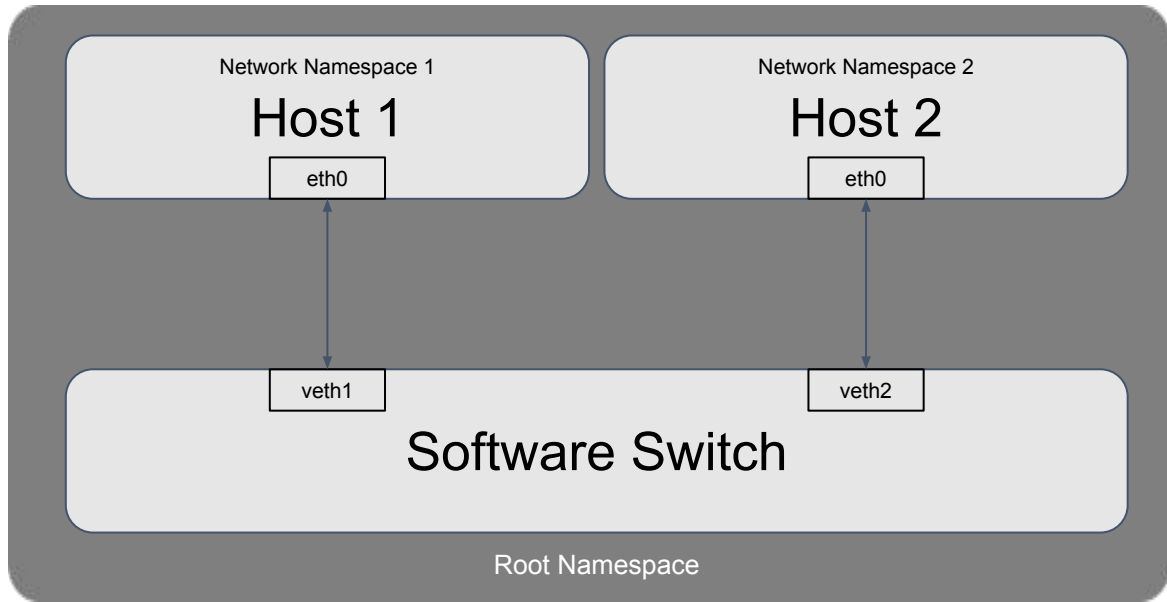

# Mininet Nodes

- A node is a process (or group of processes) that no longer has access to all the host system's native network interfaces
- Nodes are then assigned virtual Ethernet interfaces, which are connected to other containers through a **virtual switch**
- Mininet connects a host and a switch using a virtual Ethernet (veth) link
- The veth link is analogous to a wire connecting two virtual interfaces

# Mininet Nodes

# How to Use Mininet

# Starting Mininet

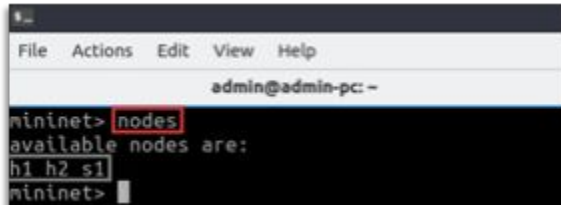

- To start a minimal topology, enter the command `sudo mn`

```
admin@admin-pc: ~  
admin@admin-pc:~$ sudo mn  
[sudo] password for admin:  
*** No default OpenFlow controller found for default switch  
*** Falling back to OVS Bridge  
*** Creating network  
*** Adding controller  
*** Adding hosts:  
h1 h2  
*** Adding switches:  
s1  
*** Adding links:  
(h1, s1) (h2, s1)  
*** Configuring hosts  
h1 h2  
*** Starting controller  
  
*** Starting 1 switches  
s1 ...  
*** Starting CLI:  
mininet> 
```

# Mininet Commands

- To display the available nodes, enter the command `nodes`

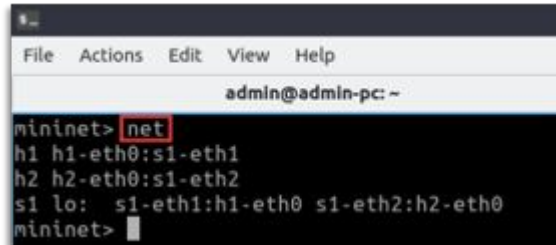

```
File Actions Edit View Help
admin@admin-pc: ~
mininet> nodes
available nodes are:
h1 h2 s1
mininet> 
```

# Mininet Commands

- To display the links between the devices, type `net`

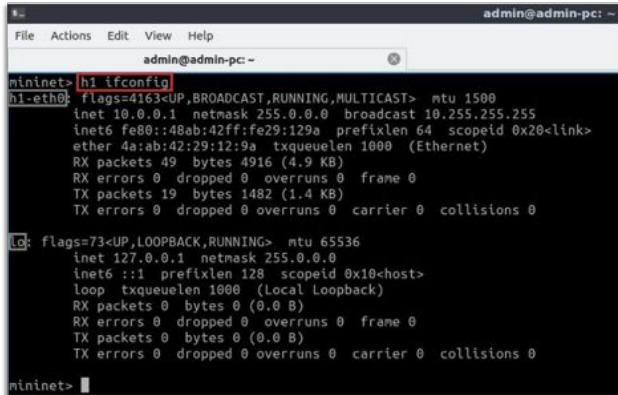

```
File Actions Edit View Help
admin@admin-pc: ~
mininet> net
h1 h1-eth0:s1-eth1
h2 h2-eth0:s1-eth2
s1 lo: s1-eth1:h1-eth0 s1-eth2:h2-eth0
mininet> 
```

# Mininet Commands

- To execute commands from a specific device, type the device first, followed by the command
- E.g., execute the command `ifconfig` on host `h1`, type `h1 ifconfig`

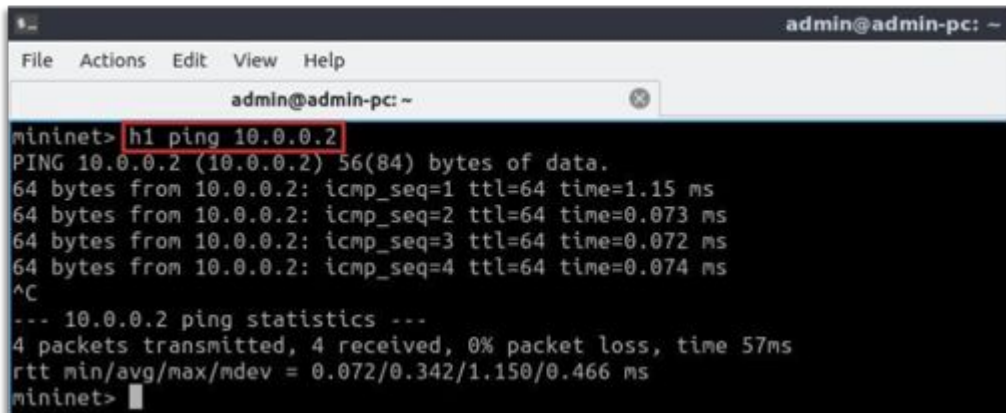

```
admin@admin-pc: ~
File Actions Edit View Help
admin@admin-pc: ~
mininet> h1 ifconfig
h1-eth0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> ntu 1500
inet 10.0.0.1 netmask 255.0.0.0 broadcast 10.255.255.255
inet6 fe80::48ab:42ff:fe29:129a prefixlen 64 scopeid 0x20<link>

RX packets 49 bytes 4916 (4.9 KB)
RX errors 0 dropped 0 overruns 0 frame 0
TX packets 19 bytes 1482 (1.4 KB)
TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING> ntu 65536
inet 127.0.0.1 netmask 255.0.0.0
inet6 ::1 prefixlen 128 scopeid 0x10<host>
loop txqueuelen 1000 (Local Loopback)
RX packets 0 bytes 0 (0.0 B)
RX errors 0 dropped 0 overruns 0 frame 0
TX packets 0 bytes 0 (0.0 B)
TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
mininet>
```

# Mininet Commands

- To test connectivity between end-hosts, use the ping command.
- Type `h1 ping 10.0.0.2` to test the connectivity between host h1 and host h2 (10.0.0.2)

```
admin@admin-pc: ~
File Actions Edit View Help
admin@admin-pc: ~
mininet> h1 ping 10.0.0.2
PING 10.0.0.2 (10.0.0.2) 56(84) bytes of data.
64 bytes from 10.0.0.2: icmp_seq=1 ttl=64 time=1.15 ms
64 bytes from 10.0.0.2: icmp_seq=2 ttl=64 time=0.073 ms
64 bytes from 10.0.0.2: icmp_seq=3 ttl=64 time=0.072 ms
64 bytes from 10.0.0.2: icmp_seq=4 ttl=64 time=0.074 ms
^C
--- 10.0.0.2 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 57ms
rtt min/avg/max/mdev = 0.072/0.342/1.150/0.466 ms
mininet> |
```

# Mininet Topology

- Default topology is two hosts and one switch
- `sudo mn --topo single,3` gives single switch and three hosts
- `sudo mn --topo linear,3` gives three switch and three hosts
- `sudo mn --topo tree,fanout=2,depth=2` gives a tree topology with depth of two and fanout of two
- You can also pass in a custom topology
  - `sudo mn --custom <file_name> --topo=<topology_name>`
  - <http://mininet.org/walkthrough/#custom-topologies>

# Network Function Virtualization

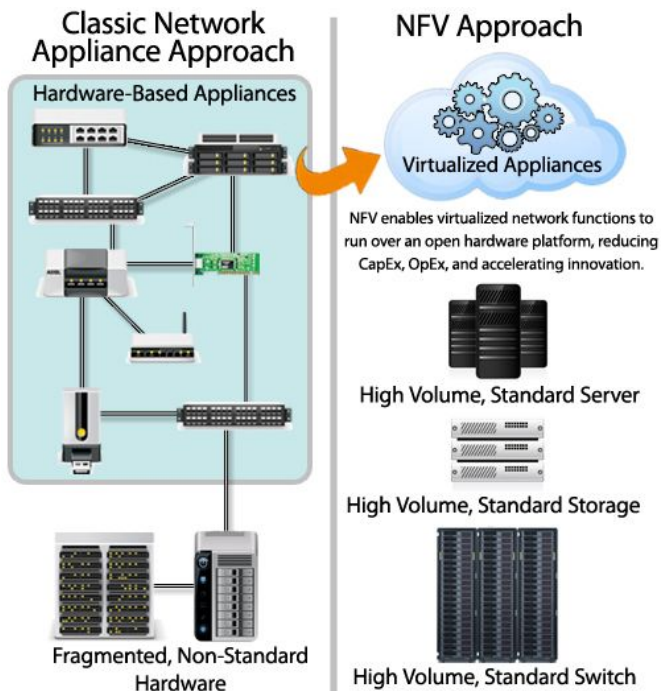

# What is Network Function Virtualization (NFV)?

- Move network control functions from switch firmware into software
  - I.e., **Virtualize** the network function or network services
- Relies on server virtualization
  - OpenStack & VMWare are primarily used
  - Functions / Services are packaged as VMs and run on **commodity hardware**
- Widely used in Telcos
- Example of network function virtualization include:
  - **DHCP**: dynamic host configuration protocol (assign IPs)
  - **Firewalls**: filter and modify traffic to secure networks
  - **DPI**: deep packet inspection: scans packet data
  - **IDS**: intrusion detection systems scan network for attacks
  - **NTP**: network time protocol
- Not NFT

# What is Network Function Virtualization?

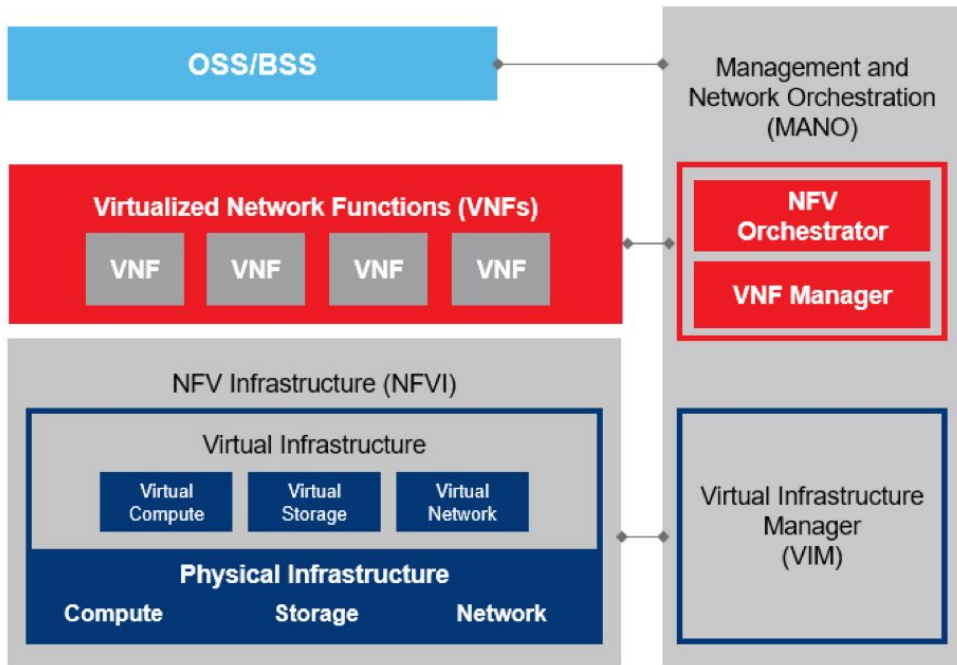

# NFV Frameworks

- There are three components to NFV framework
- Network functions virtualization infrastructure (NFVi) is all the hardware and software components that build the environment where NFVs are deployed
  - Can span several locations like a distributed system
- Virtualized network functions (VNFs) are software implementations of network functions deployed to NFVI
- **Management, automation and network orchestration (MANO)** is an architectural framework for managing and orchestrating VNFs and other software components

# NFV Frameworks

OSS/BSS = Operational Support System / Business Support System

# Pros & Cons of NFV

- Advantages
  - Reduced space needed for network hardware
  - Reduce network power consumption
  - Reduced network maintenance costs
  - Easier network upgrades
  - Longer life cycles for network hardware
  - Reduced maintenance and hardware costs
  - Easy to scale

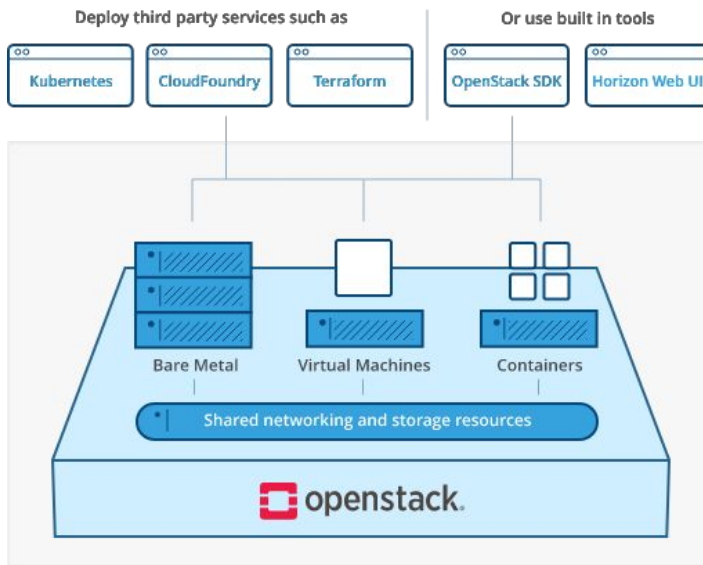

# Pros & Cons of NFV

- Disadvantages
  - NFV also demands a process realignment so that traditional and virtual infrastructure can be managed simultaneously
  - NFV requires managing IT in the abstract sense
  - NFV environments are more dynamic than traditional ones, which might require scaling up with additional features to cope with the speed of upgrade

# Want to try out NFV?

- Way to create your own private cloud
  - <https://www.openstack.org/>
  - Basically having your own AWS

# Want to try out NFV?

- Openstack is often used for NFV Deployment, especially in Telcos
  - Verizon:  
<https://www.verizon.com/about/news/verizon-launches-industry-leading-large-openstack-nfv-deployment>
  - Tutorial: <https://www.udemy.com/course/openstack-telcocloud-asad/>
- We may revisit this in Advanced Cloud Computing class

# SDN & NFV

- NFV and SDN are not dependent on each other, but have similarities and differences
- NFV and SDN can be used together
- Similarities
  - Both rely on virtualization and use network abstraction, but how they separate functions and abstract resources is different.
  - Both use commodity hardware
- Differences
  - SDN separates network forwarding functions from network control functions with the goal of creating a network that is centrally manageable and programmable.
  - NFV abstracts network functions from hardware. NFV supports SDN by providing the infrastructure on which SDN software can run.

# TODOs!

- HW 3
- Quiz 3

# Agenda for Today

- OpenFlow Part II
- Mininet
- NFV
  - Openstack
